

ABSTRACT OF THE DISCLOSURE

The SCAM (Super Conducting Action Motor) is an electrical apparatus for generating a one-directional, propulsive force. This application exploits relativistic electrodynamics in such a way that the analysis would not be possible using conventional electromagnetic theory, although the two theories ^{[1], [2]} are the same. The SCAM consists of two connected parallel plates of super-conducting elements mounted in a non-conducting substrate. Current is pulsed through the conducting elements in a controlled manner to produce unequal forces on the two plates, yielding a net force in one direction.
